No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                               M64347

OTHER RAGI PROPERS AND AS WISHING THE GENES ENCORING THE COMPINITY OF THE FUNCTION: DURING SING THE COMPINITY OF THE FUNCTION OF AN OFFICE STREET OF THE COMPINITY OF THE RAGI PRAGICALISE From a continuatorial process, known as VIDJ recombination, allows the generation of an enormous range of binding specificities from a limitate amount of genetic information. The RAGI/RAG2 complex initiates this process by binding to the conserved recombination signal sequences (RSS) and introducing a double-strand break between the RSS and the adjacent coding segment. These breaks are generated in two steps, nicking of one strand (hydrolysis).

Collowed by hairpin formation (transesterification). RAGI/2 has also been shown to function as a transposase in vitro, and to possesses RSS-independent endonuclease activity (end processing) and hairpin opening. RAGI alone can bind to RSS but stable, efficient breakence of both proteins.

OF COPACTOR: Binds I magnesium or manganese ion per subunit.

STRUCTLULIAR LOCATION: Nuclear.

Colficient of the presence of both proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This SWISS-PROT entry is copyright. -!- SUBCELLULAR LOCATION: Nuclear (By similarity).
-!- SIMILARITY: Belongs to the TALE/IRO homeobox family.
-!- SIMILARITY: Contains 1 homeobox domain.
-!- CAUTION: Ref.4 sequence differs from that shown due to frameshift in position 430.

A structure, organization, and chromosomal mapping of the gene encoding macrosialin, a macrophage restricted protein.";

Genomics 50:199-205 (1998).

-! FUNCTION: Could play a role in phagocytic activities of tissue macrophages, both in intracellular lyseomal metabolism and extracellular cell-cell and cell-pathogen interactions. Bind to tissue and organ-specific lectins or selectins, allowing homing of macrophage subsets to particular sites. Rapid recirculation of CBG8 from endosomes, lyseosomes to the plasma membrane may allow macrophages to crawl over selectin bearing substrates or other
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This SWISS-PROT entry is copyright. Becker W., Jost H.-G.;
Becker W., Jost H.-G.;
Becker W., Jost H.-G.;
Submitted (NOV-196) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: In vitro; can phosphorylate histones H3 and H2B on Ser and Thr residues. May be involved in the regulation of cellular growth and/or development.
-!- FUNCELLULAR LOCATION: Cytoplasmic.
-!- FTM: Autophosphorylated on tyrosine residues.
-!- FTM: Autophosphorylated on tyrosine residues.
-!- SIMILARITY: Belongs to the Ser/Thr family of protein kinases.
MNB/DYRK subfamily:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ATP (BY SIMILARITY).

                                                     1. CONSCIPCR: Binds 1 zinc ion per subunit (By similarity).

2. SUBCELDULAR LOCATION: Secreted. Associated with the extracellular matrix (By similarity).

2. SUBCELDULAR LOCATION: Secreted. Associated with the extracellular matrix. (By similarity: Expressed at low level, primarily in placenta but also in other tissues, such as heart and brain, and also cervix, uterus. bladder, esophagus, rib cartilage, chondroblastoma, fibrous tissue and joint capsule from an arthritic patient.

2. DOMAIN: The spacer domain and the TSP type-1 domains are important for a tight interaction with the extracellular matrix.

3. PTM: The precursor is cleaved by a furin endopeptidase (By similarity).

3. SIMILARITY: Contains 1 disintegrin-like domain.

3. SIMILARITY: Contains 2 TSP type-1 domains.
involved in its turnover. May play an important role in the destruction of aggrecan in arthritic diseases. May play a role in proteolytic processing mostly during the peri-implantation period. CATALYTIC ACTIVITY: Cleaves aggrecan at the 392-Glu-|-Ala-393

J. Hum. Genet. 60:515-524(1997).

-!- DISEASE: Defects in TCOF1 are the cause of Treacher Collins syndrome (TGS) [WM:154500]. TCS is an autosomal dominant disorder of craniofacial development that occurs with an incidence of 1/50,000 live births. The clinical features of TGS are bilaterally symmetrical and include: (1) abnormalities of the external ears, atresia of the external ear canals, and malformation of the middle ear ossicles, which may result in conductive hearing loss; (2) lateral downward sloping of palpebral fissures, frequently with colbomas of the lower eyelids; (3) hypoplasia of the mandible and zygomatic complex; (4) cleft palate.

-I SIMILARITY: Contains 1 Lish domain.

Blaesing O.E., Gowik U., Wolf B., Westhoff P.;

Submitted (MAY-2000) to the EMBL/GenBank/DDBJ databases.

-!- FUNCTION: TO PORM OXALOACETARE, A FOUR-CARBON DICARBOXXLIC ACID

SOURCE FOR THE TRICARBOXYLIC ACID CYCLE (BY SIMILARITY).

-!- CATALYTIC ACTIVITY: PHOSPHATE + OXALOACETAIE = H(2)O +

PHOSPHORNOLPYRRUYAT + CO(2).

-!- BATHAX: TRICARBOXYLIC ACID CYCLE.

-!- SIMILARITY: BELONGS TO THE PEPCASE FAMILY.
